

NEXUS PATHWAYS AI™

Replit Product Build Plan

Secure Correctional Education • Accessibility • Workforce • Reentry

Purpose of this document

Use this PDF as the governing build specification for Replit Agent. It defines the phased product roadmap, data architecture, security and accessibility requirements, national multi-tenant design, quality gates, and the first implementation prompt. The product should be built incrementally; do not ask Replit to implement the full platform in one pass.

Prepared as an upload-ready development specification
September 2026

1. How to Use This PDF in Replit

1. Create a new Replit project for Nexus Pathways AI.
2. Upload this PDF to the project so Replit Agent can reference the product specification.
3. Tell Agent to read the uploaded build plan before writing code and to work on one phase at a time.
4. Start with Phase 0 and Phase 1 only. Do not approve later phases until the exit gate for the current phase passes.
5. Require Agent to run tests, summarize changes, and update project documentation after every major phase.
6. Keep the application portable: the source code must be able to deploy outside Replit later using containers and standard infrastructure.

Recommended instruction to Agent

“Read the attached Nexus Pathways AI Replit Product Build Plan. Treat it as the governing product specification. Implement only the phase I name in my prompt. Do not skip security, tenant isolation, tests, audit logging, accessibility review, or documentation.”

2. Product Vision

Nexus Pathways AI is a secure, multi-tenant correctional education platform designed to support county jails, juvenile justice programs, state Departments of Corrections, federal correctional settings, adult education programs, and reentry organizations. The system is designed to support education from intake through release while remaining usable in restrictive institutional technology environments.

Module	Primary Purpose
Pathways Learn™	Learner-facing education experience
Pathways Assess™	Placement, diagnostics, practice assessment, mastery
Pathways Access™	Accessibility, disability supports, and applicable special-education workflows
Pathways Tutor AI™	Restricted, curriculum-bounded educational assistance
Pathways Educator™	Instructor, cohort, intervention, and progress workflows
Pathways Command™	Facility, agency, state, and executive analytics
Pathways Career™	Career exploration, employability, workforce readiness
Pathways Reentry™	Pre-release planning and continuity of services
Pathways Passport™	Permitted learner achievements and post-release continuity
Pathways Connect™	APIs, identity, LMS, assessment, and correctional-system integrations

Core strategy

Build one national codebase. Customers should be configured as tenants, not as separate forks of the application.

Escambia County Corrections can be the first demonstration tenant, but the architecture must support a single facility or an entire statewide correctional system.

3. Target System Architecture

Design Principle	Requirement
Multi-tenant	Every operational record must be scoped to an organization/agency/facility context.
Portable	No critical feature may depend exclusively on Replit hosting.
Secure by design	Authorization, auditing, tenant isolation, and least privilege are built into every module.
Accessible by design	Accessibility is part of the base UI and testing process, not a later skin.
AI optional	Agencies can disable AI without breaking the core education platform.
Restricted-network capable	Architecture must support cloud, private cloud, and local/edge deployments.
Configurable	Tenant feature flags control modules, policies, and agency-specific workflows.
Evidence-based claims	Never claim certification or compliance status without supporting review/evidence.

4. Non-Negotiable Product Rules

- One codebase must support a small county jail and a statewide correctional system.
- Every new feature must respect tenant and facility boundaries at both UI and API levels.
- Sensitive disability/special-education records require additional permissions and audit logging.

- The learner interface must not provide unrestricted web browsing, messaging, arbitrary uploads, or open internet communication.
- The AI tutor must never diagnose disabilities, approve accommodations, create an official IEP without authorized staff involvement, or provide facility-security assistance.
- Practice content must not be represented as an official GED or TABE examination unless a valid licensed integration exists.
- Accessibility accommodations must be configurable and must not automatically alter official standardized testing rules.
- Every major feature must include automated tests and documentation before it is considered complete.

5. Phased Replit Development Roadmap

Phase 0 - Product Governance & Documentation

Goal: Create the permanent rules Replit must follow before feature development begins.

- Create /docs with PRODUCT_VISION.md, PRODUCT_REQUIREMENTS.md, SECURITY_REQUIREMENTS.md, ACCESSIBILITY_REQUIREMENTS.md, DATA_CLASSIFICATION.md, USER_ROLES.md, DATABASE_RULES.md, AI_SAFETY_RULES.md, DEPLOYMENT_REQUIREMENTS.md, and CODING_STANDARDS.md.
- Define feature flags for ABE, HSE, Special Education, Accessibility, AI Tutor, Career, Reentry, Passport, and Offline Mode.
- Define data sensitivity levels and which roles can access each class of data.

Exit gate

All governing documents exist, are internally consistent, and Agent confirms that later work will follow them.

Phase 1 - Foundation, Authentication & Multi-Tenancy

Goal: Create the secure skeleton of the national platform.

- Create the monorepo/application structure, PostgreSQL database, typed ORM, environment configuration, and Docker-compatible setup.
- Implement Organization → Agency → Region → Facility → Program → Cohort hierarchy.
- Implement secure authentication, role-based access control, granular permissions, session controls, and audit-event framework.
- Seed one Escambia County Corrections demo tenant with synthetic data only.
- Create simple authenticated Learner, Educator, and Administrator shells.

Exit gate

Automated tests prove authentication, tenant isolation, facility isolation, role restrictions, and audit-event generation.

Phase 2 - National Organizational Model

Goal: Make the same system usable by counties, states, and federal organizations.

- Complete the organizational hierarchy and scoped administrator views.
- Allow agency administrators to manage facilities and programs beneath their scope.
- Prevent facility users from traversing URLs or APIs into another facility or tenant.
- Create configuration management for tenant-specific modules and policy settings.

Exit gate

A state-level demo administrator can see multiple facilities, while a facility administrator can see only the assigned facility.

Phase 3 - Pathways Learn™

Goal: Build the secure learner experience.

- Create learner home page, assigned coursework, progress, learning goals, instructional hours, approved resources, and accessibility toolbar.
- Keep navigation simple and suitable for desktop/tablet use in institutional environments.
- Block direct messages, social features, unrestricted URLs, arbitrary file uploads, and unauthorized external communication.
- Add session timeout and configurable inactivity controls.

Exit gate

A learner can log in, complete assigned demo content, and never access educator/admin functions or another learner account.

Phase 4 - Curriculum Management Engine

Goal: Create a configurable content system rather than hardcoded lessons.

- Implement Course → Subject → Module → Unit → Lesson → Activity → Assessment → Skill structure.
- Support ABE 1-6, HSE preparation, literacy, ESL, digital literacy, financial literacy, workforce, and reentry categories.
- Create staff-authoring workflows for lessons and versioned content publishing.
- Add content status: Draft, Review, Approved, Published, Retired.

Exit gate

Authorized staff can create and publish a sample course without code changes; learners only see approved content.

Phase 5 - Pathways Assess™

Goal: Build placement, diagnostic, mastery, and practice assessment capability.

- Implement placement, diagnostic, lesson quiz, unit assessment, post-assessment, and practice assessment types.
- Create structured question metadata: subject, domain, skill, learning objective, difficulty, level, question type, explanation, and remediation lesson.
- Add attempt history, scoring, mastery updates, and educator review.
- Separate internally created practice assessments from official/licensed exams.

Exit gate

Scores are reproducible, mastery calculations are tested, and question access is protected from unauthorized users.

Phase 6 - Adaptive Learning Engine

Goal: Turn assessment evidence into individualized instruction.

- Calculate skill mastery by learner and subject.
- Identify persistent skill gaps and generate prioritized learning recommendations.
- Generate an Individual Learning Plan with staff override capability.
- Advance or remediate learners based on configurable mastery thresholds.
- Retain recommendation history so staff can understand why assignments were made.

Exit gate

Given known synthetic assessment results, the engine produces the expected learning plan and recommendations.

Phase 7 - Pathways Access™

Goal: Integrate accessibility and applicable disability/special-education workflows.

- Create AccessibilityProfile, Accommodation, AccommodationAssignment, IEP, IEPGoal, IEPPProgress, IEPService, Evaluation, TransitionPlan, RelatedService, ServiceDeliveryLog, AssistiveTechnology, AccommodationApproval, and AccessibilityAuditLog models.
- Support adult accommodation plans separately from IEP workflows.
- Implement text-to-speech hooks, keyboard navigation, text scaling, high contrast, spacing controls, captions/transcripts, focus mode, reduced-distraction mode, and step-by-step/simplified instructional modes.
- Add special-education coordinator dashboard with due-date reminders and progress monitoring.
- Restrict disability/special-education records with dedicated permissions.

Exit gate

Accessibility workflows function without exposing diagnosis/documentation to roles that only need to know the approved instructional support.

Phase 8 - Adaptive Accessibility

Goal: Make instructional presentation respond to approved supports.

- Allow authorized staff to set learner accessibility preferences and accommodations.
- Expose learner controls only where policy permits.
- Add “Read Aloud,” “Simplify,” “Break Into Steps,” “Define This Word,” “Show an Example,” “Practice With Me,” and “Focus Mode” interfaces.
- Ensure standard content remains usable when optional assistive services are unavailable.

Exit gate

A learner with an assigned accessibility profile receives the configured presentation supports without changing another learner’s experience.

Phase 9 - Pathways Tutor AI™

Goal: Add an optional, closed-domain educational tutor.

- Ground AI responses in approved curriculum and learner-authorized academic context.
- Allow explanations, hints, examples, practice, simplification, and approved translation assistance.
- Block unrestricted web access, external communication, security-sensitive assistance, disability diagnosis, accommodation approval, and unilateral IEP modification.
- Create agency-level and tenant-level kill switches for AI.
- Log AI interactions according to policy and minimize exposure of sensitive records.

Exit gate

Red-team tests show the tutor refuses prohibited requests and still supports approved educational help. Core product works with ENABLE_AI_TUTOR=false.

Phase 10 - Pathways Educator™

Goal: Give instructors actionable academic workflows.

- Build cohort rosters, assignment management, diagnostics, mastery views, interventions, instructional-hour tracking, approved accommodation views, and progress reporting.
- Allow educators to create and revise learning plans within assigned scope.
- Create alerts for learners needing intervention or reassessment.
- Ensure educators only see special-education information required for their role.

Exit gate

An educator can manage a cohort end-to-end without receiving administrative or cross-facility privileges.

Phase 11 - Pathways Command™

Goal: Create facility, agency, regional, and statewide analytics.

- Provide active learners, program enrollment, instructional hours, skills gains, completion, readiness, credentials, and program outcomes.
- Implement drill-down hierarchy: Agency → Region → Facility → Program → Cohort → Learner.
- Create administrator filters and export controls.
- Design synthetic statewide demo dashboards to prove scale.

Exit gate

Metrics reconcile to underlying test data and each administrator sees only authorized organizational scope.

Phase 12 - Pathways Career™

Goal: Connect education to workforce preparation.

- Create career-interest and skills assessments, career plans, employability modules, digital literacy, financial literacy, resume preparation, interview preparation, and credential tracking.
- Map academic skills to career pathways.
- Allow agencies to configure available occupational pathways and partners.
- Support staff review and learner progress tracking.

Exit gate

A learner can move from career assessment → career plan → assigned learning → credential/progress record.

Phase 13 - Pathways Reentry™

Goal: Create pre-release readiness planning.

- Create configurable reentry domains such as education, employment, identification, housing planning, transportation, financial literacy, digital skills, and community-resource referrals.
- Add agency-configurable checklists rather than hardcoded national resources.
- Allow case managers to track tasks, milestones, approvals, and release readiness.

Exit gate

A case manager can produce a complete synthetic reentry plan without exposing unrelated protected records.

Phase 14 - Pathways Passport™

Goal: Preserve permitted achievements after release.

- Create a controlled transition from restricted institutional identity to a civilian account where permitted.
- Carry forward approved achievements, credentials, resume, career plan, skills, and education goals.
- Do not automatically transfer disability, medical, security, or other sensitive correctional information.
- Require explicit policy/consent workflows for any protected transfer.

Exit gate

The transfer test demonstrates an allow-list model: only approved fields are copied to the civilian profile.

Phase 15 - Government-Grade Reporting

Goal: Create auditable operational and outcome reports.

- Generate individual progress, learning plan, pre/post assessment, readiness, attendance, instructional hours, completion, credential, cohort, facility, accessibility-support, IEP-progress where applicable, career, and reentry reports.
- Export to PDF and CSV first; add XLSX and API/JSON as the platform matures.
- Protect exports with permission checks and audit events.

Exit gate

Generated reports match source data and export attempts by unauthorized roles are blocked and logged.

Phase 16 - Pathways Connect™

Goal: Create the integration layer needed for national adoption.

- Design versioned REST APIs and webhook architecture.
- Prepare integration adapters for SAML/OIDC SSO, SCIM, CSV, secure file transfer, SCORM, xAPI, and LTI where appropriate.
- Keep vendor-specific connectors separate from the core domain model.
- Document integration contracts and authentication methods.

Exit gate

A documented sandbox API can exchange non-sensitive synthetic learner/course data without bypassing authorization rules.

Phase 17 - Cloud, Private & Edge Deployment

Goal: Make restrictive correctional deployments realistic.

- Package application services for container deployment.
- Support Pathways Cloud, dedicated/private environment, and Pathways Edge on a facility LAN.
- Design local authentication/content/database operation for approved no-public-internet deployments.
- Create controlled content/software update workflow, backup process, and recovery procedure.

Exit gate

A test environment operates through the defined local-network mode without learner public internet access.

Phase 18 - Security Hardening

Goal: Stop feature work and perform a dedicated security pass.

- Test authentication, MFA architecture, session controls, password reset, rate limits, authorization, IDOR, cross-tenant access, XSS, CSRF, injection, file handling, secrets, exports, APIs, and backups.
- Test every high-privilege role and sensitive record route.
- Add automated security regression tests for issues discovered.
- Document unresolved risks instead of hiding them.

Exit gate

No known critical/high authorization or tenant-isolation defect remains open for the demo release.

Phase 19 - Accessibility QA

Goal: Verify accessibility rather than merely claiming it.

- Test keyboard-only navigation, focus order, screen-reader labels, headings, forms, errors, color contrast, text resizing, tables, dialogs, captions, and time-limit behavior.
- Create a remediation log and repeat tests after fixes.
- Prepare the product for future formal accessibility conformance review.

Exit gate

The internal accessibility checklist passes for all critical learner and staff workflows, with known limitations documented.

Phase 20 - Procurement Demonstration Tenants

Goal: Create realistic sales/demo environments.

- Build Escambia County Corrections demo with synthetic learners and several months of synthetic progress.
- Build a statewide demo tenant with multiple regions/facilities and aggregate synthetic data.
- Create demo scripts for learner, educator, special-education/accessibility coordinator, facility administrator, and state administrator.
- Ensure every demo uses fictional data and clearly indicates demo status.

Exit gate

A complete procurement demo can move through student → educator → accessibility coordinator → facility admin → statewide executive workflows without manual database edits.

6. Recommended Sprint Sequence

Sprint	Primary Build	Do Not Advance Until
01	Architecture & governing docs	Product structure fixed
02	Database & tenancy	Isolation tests pass
03	Authentication & RBAC	Permission tests pass
04	Learner UI	Core learner workflow works
05	Curriculum engine	Content is configurable
06	Assessment engine	Scoring verified
07	Adaptive learning	Recommendations verified
08	Pathways Access	Accessibility/special-ed workflows work
09	Educator dashboard	Instructor workflow works
10	Command dashboard	Facility/agency analytics work
11	AI Tutor	Guardrails tested

12	Career	Career plan works
13	Reentry	Reentry plan works
14	Passport	Controlled transition works
15	Reporting	Exports reconcile to data
16	Integrations	API framework works
17	Edge deployment	Restricted-network test passes
18	Security	Security review passes
19	Accessibility QA	Accessibility checklist passes
20	Escambia + statewide demo	Procurement demo ready

7. Initial Core Data Model

```

Organization
  -> Agency
    -> Region
      -> Facility
        -> Program
          -> Cohort
            -> Learner

```

Core domain entities:

User, Role, Permission, UserRole, Educator, Enrollment, Course, Subject, Module, Unit, Lesson, Activity, Skill, Assessment, Question, AssessmentAttempt, Mastery, LearningPlan, Assignment, InstructionalSession, CareerPlan, ReentryPlan, Credential, Report, AuditLog.

Accessibility/special-education entities:

AccessibilityProfile, Accommodation, AccommodationAssignment, IEP, IEPGoal, IEPProgress, IEPService, IEPMeeting, Evaluation, TransitionPlan, RelatedService, ServiceDeliveryLog, AssistiveTechnology, AccommodationApproval, AccessibilityAuditLog.

8. Initial Roles & Permission Model

```

ROLES
SUPER_ADMIN
AGENCY_ADMIN
REGIONAL_ADMIN
FACILITY_ADMIN
EDUCATION_DIRECTOR
SPECIAL_ED_ADMIN
EDUCATOR
CASE_MANAGER
REENTRY_SPECIALIST
AUDITOR
LEARNER

```

```

SAMPLE PERMISSIONS
VIEW_LEARNERS / EDIT_LEARNERS
VIEW_ACADEMIC_RECORDS / EDIT_ACADEMIC_RECORDS
VIEW_IEP / EDIT_IEP
VIEW_DISABILITY_RECORDS

```

MANAGE_CURRICULUM
 MANAGE_ASSESSMENTS
 VIEW_SECURITY_LOGS
 EXPORT_REPORTS
 MANAGE_TENANT_CONFIGURATION

Access-control rule

Role labels are not enough. API endpoints and database queries must enforce scoped permissions. A user must never gain access to another tenant or facility by changing a URL, identifier, API request, or client-side state.

9. Security, Privacy & Accessibility Baseline

Area	Minimum Build Expectation
Authentication	Secure password hashing, session expiration, account lockout/rate limiting, MFA architecture for privileged roles.
Authorization	Central RBAC/permissions, organization/facility scope enforcement, server-side checks on every protected action.
Audit	Log login/security events, protected record views, edits, permission changes, reports, exports, and sensitive special-ed/accessibility access.
Data	Classify sensitive data, minimize collection, encrypt transport, use secure secrets, define retention/backup/recovery.
Learner restrictions	No open browser, direct messaging, arbitrary uploads, or unapproved external communication.
Accessibility	Build toward WCAG 2.2 AA patterns; test keyboard, focus, screen-reader semantics, scaling, contrast, captions, and forms.
Disability records	Expose approved instructional accommodations separately from diagnosis/supporting documentation whenever possible.
AI	Closed-domain, optional, tenant-controlled; no diagnosis, no official accommodation approval, no security-sensitive assistance.

10. Definition of the First Sellable Demonstration

Do not wait for every national module to be complete before demonstrating the product. The first strong procurement demo should prove the platform architecture and the core education workflow.

- Escambia County demo tenant with fictional data.
- Learner login and restricted learner dashboard.
- Educator login with cohort, assignments, assessments, mastery, and learning plans.
- Accessibility profile and approved supports for several synthetic learners.
- Administrator dashboard with facility-level metrics.
- ABE/HSE sample curriculum with enough content to show end-to-end workflow.
- Placement/diagnostic demo that produces a learning recommendation.
- PDF/CSV progress report.
- Audit log and role/tenant isolation tests.
- AI Tutor may be demoed only after guardrails are working; it is not required for the earliest core demo.

11. Master Replit Starter Prompt - Phase 1 Only

Paste the following into Replit Agent after uploading this PDF. This prompt intentionally limits Agent to the architecture/foundation stage.

```
PROJECT:
Nexus Pathways AI

MISSION:
Build a secure, multi-tenant correctional education, accessibility/special-education, workforce development,
and reentry software platform for U.S. correctional agencies.

IMPORTANT:
Read the uploaded Nexus Pathways AI Replit Product Build Plan and treat it as the governing specification.
DO NOT attempt to build the complete application during this task.
THIS TASK IS ARCHITECTURE AND FOUNDATION ONLY.

The application must eventually support:
- county jails
- juvenile justice facilities
- state Departments of Corrections
- federal correctional facilities
- adult education programs
- reentry organizations

The same codebase must support one facility or an entire state correctional agency.

Create a modular, portable architecture.
Recommended stack:
- Frontend: Next.js, React, TypeScript, Tailwind CSS
- Backend: TypeScript
- Database: PostgreSQL
- ORM: Prisma or equivalent typed ORM
- Deployment: Docker-compatible

The architecture must remain portable and must not depend exclusively on Replit-specific hosting
capabilities.

Create application/module boundaries for:
- Pathways Learn
- Pathways Educator
- Pathways Command
- Pathways Access
- Pathways Assess
- Pathways Career
- Pathways Reentry
- Pathways Tutor AI
- Pathways Connect

CREATE THE MULTI-TENANT DATA MODEL:
Organization
Agency
Region
Facility
Program
Cohort
User
Role
Permission
UserRole
Learner
Educator
Enrollment
Course
Module
Lesson
Skill
Assessment
Question
AssessmentAttempt
LearningPlan
Mastery
AccessibilityProfile
Accommodation
IEP
IEPGoal
TransitionPlan
CareerPlan
```

ReentryPlan
 Credential
 InstructionalSession
 Report
 AuditLog

BUILD ROLE-BASED ACCESS CONTROL.

INITIAL ROLES:
 SUPER_ADMIN
 AGENCY_ADMIN
 REGIONAL_ADMIN
 FACILITY_ADMIN
 EDUCATION_DIRECTOR
 SPECIAL_ED_ADMIN
 EDUCATOR
 CASE_MANAGER
 REENTRY_SPECIALIST
 AUDITOR
 LEARNER

Every data record must belong to the correct tenant and organizational scope.
 Prevent cross-tenant and cross-facility access at both application and API levels.
 Create a centralized permission system.
 Implement secure authentication and audit-logging architecture.

Create configuration-based feature flags:

ENABLE_ABE
 ENABLE_HSE
 ENABLE_SPECIAL_ED
 ENABLE_ACCESSIBILITY
 ENABLE_AI_TUTOR
 ENABLE_CAREER
 ENABLE_REENTRY
 ENABLE_PASSPORT
 ENABLE_OFFLINE_MODE

CREATE DOCUMENTATION:

/docs/PRODUCT_VISION.md
 /docs/SYSTEM_ARCHITECTURE.md
 /docs/DATABASE_SCHEMA.md
 /docs/SECURITY_ARCHITECTURE.md
 /docs/RBAC.md
 /docs/DATA_CLASSIFICATION.md
 /docs/ACCESSIBILITY_REQUIREMENTS.md
 /docs/AI_SAFETY_RULES.md
 /docs/DEPLOYMENT_ARCHITECTURE.md

Build a simple authenticated shell showing:

- Learner Portal
- Educator Portal
- Administrator Portal

Do not build curriculum, AI tutor, assessments, career planning, or reentry features yet.

SEED DATA:

Create one DEMO tenant named Escambia County Corrections.
 Create 1 agency, 1 facility, 1 administrator, 2 educators, and 10 synthetic learners.
 No actual inmate, medical, disability, or protected data may be included.

TESTS:

Create and run tests verifying:

1. Authentication works.
2. Tenant isolation works.
3. Facility isolation works.
4. Role permissions work.
5. Learner cannot access educator routes.
6. Educator cannot access system-administration routes.
7. Audit events are generated.

Before finishing:

- Run the test suite.
- Fix failures.
- Update documentation.
- Produce a build summary listing files created, database tables, routes, tests, known limitations, and the recommended next development step.

DO NOT add functionality outside this scope.

12. Permanent Replit Project Instruction

NEXUS PATHWAYS DEVELOPMENT RULE

Never implement a new major feature without:

1. Checking tenant isolation.
2. Checking role-based authorization.
3. Adding audit events where applicable.
4. Adding automated tests.
5. Updating documentation.
6. Checking accessibility implications.
7. Checking offline/restricted-network implications.
8. Checking whether sensitive data is involved.

Never claim the product is:

- CJIS compliant
- FERPA compliant
- HIPAA compliant
- SOC 2 certified
- FedRAMP authorized
- Section 508 compliant
- ADA compliant
- IDEA compliant

unless authorized human review and supporting evidence establish that claim.

The application may instead state that it is designed to support applicable requirements.

13. Replit Agent Working Pattern for Every Later Phase

7. Tell Agent the exact phase number and title to implement.
8. Tell Agent to read this build plan and relevant /docs files first.
9. Tell Agent not to add unrelated features or redesign working modules.
10. Require database migration review before applying destructive schema changes.
11. Require automated tests for permissions, tenant/facility scope, and the new feature.
12. Require an accessibility check for any new learner or staff interface.
13. Require audit events for protected data reads/writes and administrative actions.
14. Run tests and fix failures before declaring the phase complete.
15. Update documentation and produce a concise build summary and known-limitations list.

14. Product Quality Gate Before Government Demonstrations

Category	Ready When
Tenant isolation	Cross-tenant/cross-facility authorization tests pass.
Learner security	Learners cannot access staff routes, messaging, unrestricted web, or unapproved files.
Sensitive records	Disability/special-ed data is permission-scoped and audited.
Assessments	Scores and mastery calculations are reproducible and test-covered.
Reporting	Demo reports reconcile to source records.
Accessibility	Core workflows pass internal keyboard/screen-reader/contrast/scaling checks.

AI	Prohibited AI request tests pass and AI can be fully disabled.
Audit	Critical views/edits/exports/admin changes appear in logs.
Deployment	Development build is containerized/portable and documented.
Demo data	All demonstrations use synthetic/fictitious learners and facilities are clearly marked Demo unless representing a named target tenant configuration.

15. Scale Path After the First Demo

Stage	Primary Objective
1. County pilot	Win a county correctional/education customer or approved pilot; validate usability and procurement requirements.
2. Florida expansion	Reuse the platform for additional county corrections and state-level conversations.
3. State enterprise	Prove multi-facility analytics, integrations, accessibility, security, and deployment flexibility.
4. National county/state	Build repeatable procurement packages, implementation playbooks, and integrations.
5. Federal/subcontract	Pursue federal opportunity readiness, prime partnerships, security requirements, and federal accessibility/cloud strategy as justified.

16. Immediate Action Checklist

- Create the Nexus Pathways AI Replit project.
- Upload this PDF.
- Paste the Master Replit Starter Prompt from Section 11.
- Allow Agent to complete Phase 1 only.
- Review the generated database schema, roles, routes, tests, and /docs files.
- Do not proceed if tenant/facility isolation tests fail.
- Once Phase 1 is clean, instruct Agent to implement Phase 2 using this PDF as the governing plan.
- Continue one phase at a time, retaining test evidence and build summaries for future security/procurement documentation.

Bottom line

The fastest way to create a credible national correctional software product is not to ask AI to build everything at once. Use Replit as an engineering accelerator, but make the product architecture disciplined, portable, secure,

accessible, and multi-tenant from the first commit. Build a tested foundation first; then layer education, accessibility, AI, workforce, reentry, reporting, integration, and edge deployment on top of it.

Implementation note: This document is a product-development plan, not a legal compliance certification. Government, education, disability, privacy, security, and procurement requirements should be reviewed for each target agency and deployment before making compliance claims or entering production.
